Susceptibility vs. Resistance - Nataliya Levkovych 2022-04-19
The topic of the volume is the contrast between borrowable categories and those which resist transfer. Resistance is illustrated for the unattested emergence of grammatical gender, the negligible impact of English and Spanish on the number category in Patagonian Welsh, the reluctance of replicas to borrow English but. MAT-borrowing does not imply the copying of rules as the Spanish function-words in the

Chamorro irrealis show. Chamorro and Tetun Dili look similar on account of their contact-induced parallels. The languages of the former USSR have borrowed largely identical sets of conjunctions from Russian, Arabic, and Persian to converge in the domain of clause linkage. Resistance against and susceptibility to transfer call for further investigations to the benefit of language-contact theory.

Site-directed insertion of transgenes - Sylvaine Renault 2012-07-30
The post-genomic era has brought new challenges and opportunities in all fields of the biology. In this context, several genome engineering technologies have emerged that will help deciphering genes function by as well as improve gene therapy strategies. Genomic modifications such as knock-in, knock-out, knock-down, sequence replacement or modification can today be routinely performed. However, in front of this large palette of methodologies scientists may experience difficulties to gather useful information's scattered within the literature. This book aims to present the state of this field from basic mechanisms of site-directed modifications to their applications in a wide range of organisms such as bacteria, yeast, plants, insects, mammals. It will discuss the problems encountered when using the random integration strategy and present the recent advances made in targeted genome modification. Technologies based on Zinc Finger nucleases, Meganucleases, TALEN, CRE and FLP recombinase, ⍰C31 integrase, transposases and resolvases are fully detailed with their strengths and weaknesses. All these information's will help students and experienced researchers to understand and choose the best technology for their own purposes.

Continued Learning of Tissue-specific Immunity from the Immuno-Pathological Spectrum of Leprosy - Pranab Kumar Das 2020-01-17
Leprosy is one of the oldest recorded debilitating diseases affecting mankind, the immunopathology of which is characterized by fluctuating granulomatous inflammation that targets mainly skin and peripheral nerve. The disease is caused by infection with Mycobacterium leprae, a slow growing obligatory intracellular and non-cultivatable organism. The disease is manifested with diverse pathology due to varied immune (both innate and adaptive) responses of the hosts as a result of cognate interaction with the organism. Of note, leprosy can be regarded as a unique model to elucidate the complexity of host immunity at both skin and systemic levels.
